

Lesson 05: Variables in Python

Complete Python Mastery

What is a Variable?

A named storage location used to store data.

```
name = "Ali"
```

The Mental Model: A Labeled Container

A variable is simply a labeled container holding a specific piece of information.

Creating Variables: The Anatomy

```
age = 20  
city = "Delhi"  
country = "India"
```

Variable Naming Rules

Allowed ✓

- ✓ Letters
- ✓ Numbers (but not at the beginning)
- ✓ Underscores (_)

Not Allowed ✗

- ✗ Spaces
- ✗ Starting with a number
- ✗ Python keywords (e.g., print, if)

Valid vs. Invalid Names

Valid

✓ student_name

✓ age

✓ marks2

✓ _city

Invalid

2name → (Cannot start with number)

my name → (No spaces allowed)

class → (Reserved keyword)

total-marks → (Hyphens are not underscores)

The Core Principles

Variables
store data.

Every variable
needs a unique
name.

Names must
follow strict
Python rules.

Variables make
programs
dynamic and
easier to write.

Let's Start Coding!

Now let's open VS Code and create our first variables.
